### 1. Initial Placement of Emergency Admission Critical Care Patients at RIE During SARS-CoV-2 Pandemic

Non SARS-CoV-2 (GREEN) Areas 116C/116D/118A

#### SARS-CoV-2 (RED) Areas

118B siderooms to be used for intermediate and high risk admissions whilst waiting for test results.

118B (beds 20-23) open area for SARS-CoV-2 Positive patients Once beds 20-23 are full, SARS-CoV-2 positive patients to be managed in 118B open area

Priority to ensure rapid patient testing and results is essential to allow patient flow and definitive placement within critical care

clear

alert organisms suspected/proven.

One negative swab URT/LRT is sufficient

to continue management in (GREEN)

non SARS-CoV-2 open area.

Discuss with ICPT

- If SARS CoV-2 positive, and no other alert organisms, move to (RED) 118B beds 20-23, therafter 118B beds 11-14 - Remain in sideroom if additional alert organisms suspected/proven. Discuss with ICPT
- Patients negative for SARS-CoV-2 can be stepped down to non SARS-CoV-2 (GREEN) areas 116C/116D/118A/ward as appropriate. Siderooms for patients with other alert organisms or who meet shielding criteria. Discuss with IPCT
- Patients are not considered to be contacts if previously managed in sideroom or non SARS-CoV-2 (GREEN) areas throughout admission. If managed in (RED) SARS-CoV-2 area, considered a contact for 14 days and require isolation in sideroom (self isolation at home) for 14 days post exposure. Discuss with IPCT
- See de-escalation and discharge flow chart

shielding criteria should

sideroom appropriate

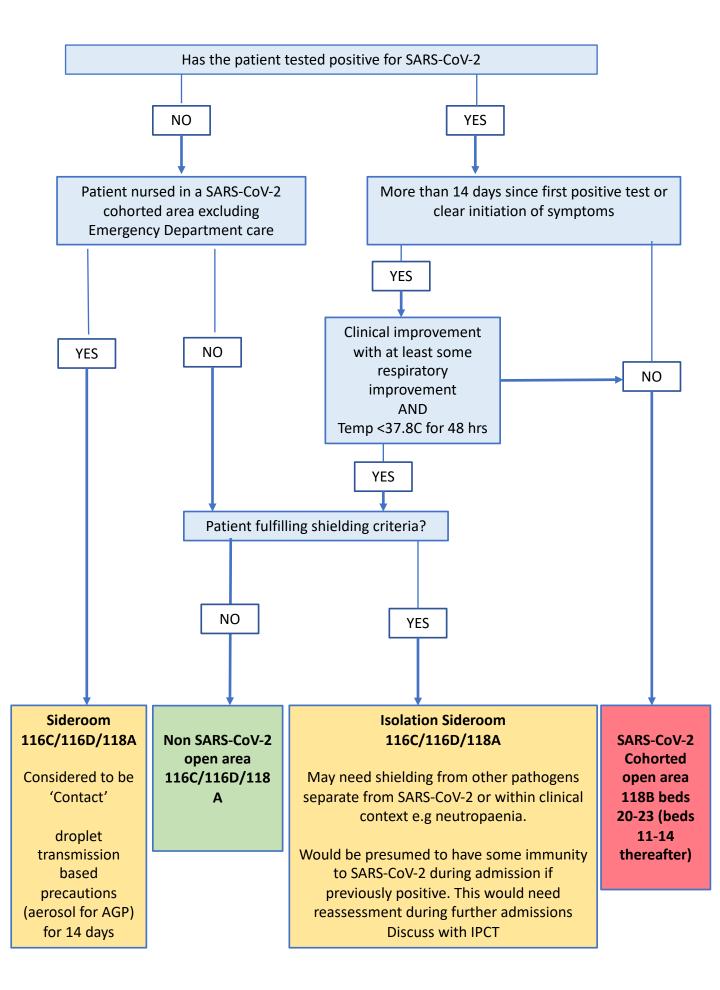

for protective isolation

116C is Level 2 Area

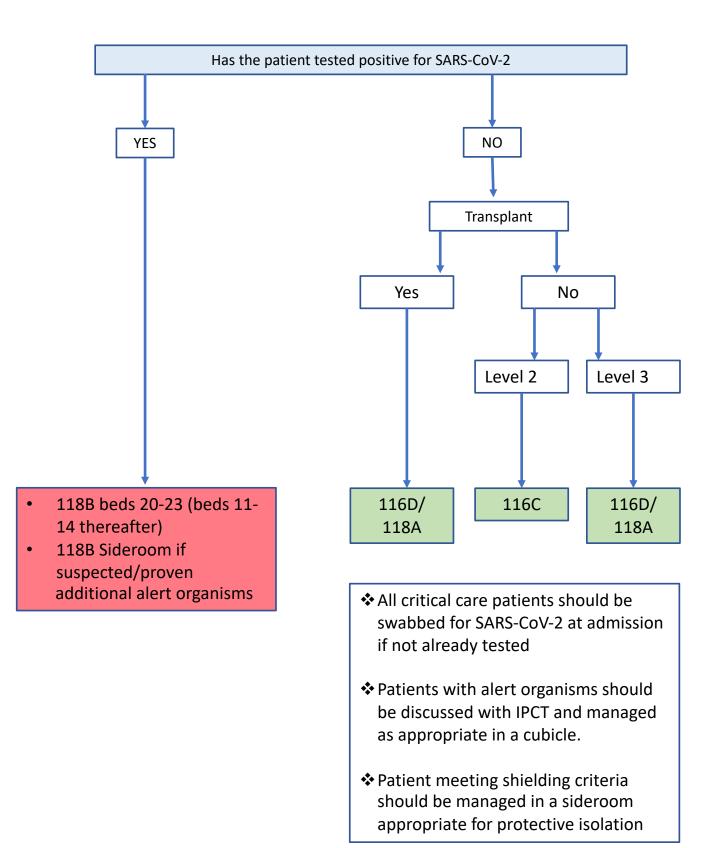

ONLY

be managed in a
